Customer Problem Statement

I am a college health and wellness administrator

I'm trying to understand and improve the dietary and nutritional habits of students

But I lack real-time, visual insights into eating behaviours, health trends, and deficiencies

Because the data is scattered, static, or underutilized for strategic wellness interventions

Which makes me feel reactive and under-equipped to support student health proactively

Problem Statement (PS)

PS-1: I am a student affairs officer who wants to monitor student nutrition habits to prevent health issues, but I don't have access to interactive tools that give real-time data on students' dietary trends.

PS-2: I am a university nutritionist trying to detect deficiencies in students' diets, but it's difficult to pinpoint problem areas without an integrated platform that shows snack overconsumption, vitamin neglect, and health perception metrics.

PS-3: I am a wellness strategist aiming to develop personalized health plans for students, but predictive analytics tools are not in place to proactively identify high-risk individuals and suggest tailored interventions.
